

Students requiring accommodations as a result of disability, must contact the Centre for Students with Disabilities 604-291-3112 or csdo@sfu.ca

This course may be applied to the
Certificate of Liberal Arts

Instructor: [Robin Insley](#)
(Burnaby & Surrey)

Prerequisite:

Students in Sociology and Anthropology are expected to take SA 255 before this course. Students with credit for STAT 101, 102, 103, 201, 270, ARCH 376 or, BUEC 232 (formerly 332), may not subsequently receive credit for this course. Recommended: a research methods course such as SA 255, CRIM 120, POL 213 or equivalent is recommended prior to taking STAT 203. Intended to be particularly accessible to students who are not specializing in Statistics.

Textbook:

Elementary Statistics in Social Research (10th ed) by Jack Levin & James Fox, Publisher: Allyn & Bacon

Calendar Description:

Introduction to descriptive and inferential statistics aimed at students in the social sciences. Scales of measurement. Descriptive statistics. Measures of central tendency. Measures of dispersion. Probability. Inferential statistics. Rationale for these procedures is explained in detail but the use of mathematical formulas is kept to a minimum. STAT 203 is a satisfactory prerequisite for STAT 302.

1. **The Design of a Statistical Study**

The two major design types, controlled experiments and observational studies, are discussed, with special emphasis on the limitations of each. The practical necessity of observational studies in social sciences research is discussed.

2. **Descriptive Statistics**

The following methods of summarizing the information in large data sets are introduced: histograms and other graphs, averages, standard deviations, and the normal approximation. Applications to the summary of social and political surveys.

3. **Correlation and Regression**

The correlation coefficient is introduced as a measure of the strength of association between two quantities; the regression line, as a graph of averages. Deviations from this line are discussed. Use of these techniques in formulating causal hypotheses based on studies in social sciences.

4. **Probability**

Methods are presented for computing the probabilities of chance occurrences. Examples are introduced which explain how probability is used to model the unpredictability of human responses.

5. **Chance Variability**

Fallacious interpretations of "The Law of Averages" are brought to light, and the predictable patterns that do indeed emerge in repetitions of chance experiments are discussed. The use of aggregation as a method for concentrating information from widely variable measurements, such as are encountered in social surveys.

6. **Sampling and Chance Models**

The concept of a sample survey is studied from the design stage through the conduct of the survey to the analysis of the results. Special attention is given to the role of chance errors on the accuracy of the results. Application to large scale surveys, such as are done regularly by Statistics Canada, are discussed.

7. **Estimation and Tests of Significance**

Elementary methods of analyzing the results of controlled experiments and observational studies are presented. Standard t-tests, chi-square tests, and related confidence intervals are introduced with emphasis on the role of the chance model, and the interpretation of the results. Methods for distinguishing reproducible trends from those that are temporary and due to sampling error are examined. Applications to surveys in sociology, criminology and political science.
